Productivity measures that use one class of inputs or factors, but not multiple factors, are called partial productivities. In practice, measurement in production means measures of partial productivity. Interpreted correctly, these components are indicative of productivity development, and approximate the efficiency with which inputs are used in an economy to produce goods and services.

Productivity - Wikipedia

Measurement of productivity Productivity can be measured, The amount of output per unit of input. In a factory, it might be measured based on the number of hours it takes to produce a good. While in service industry, might be measured based on the income generated by an employee divided by his/her salary. 4.

Productivity - SlideShare

In economics, total-factor productivity (TFP), also called multi-factor productivity, is usually measured as the ratio of aggregate output (e.g., GDP) to aggregate inputs. Under some simplifying assumptions about the production technology, growth in TFP becomes the portion of growth in output not explained by growth in traditionally measured inputs of labour and capital used in production.
