Dead zones, facts and information - Environment

That is why these areas are called dead zones. Dead zones occur because of a process called eutrophication, which happens when a body of water gets too many nutrients, such as phosphorus and nitrogen. At normal levels, these nutrients feed the growth of an organism called cyanobacteria, or blue-green algae. With too many nutrients, however, cyanobacteria grows out of control, which can be harmful.

Dead zones are hypoxic (low-oxygen) areas in the world's oceans and large lakes, which causes these bodies of water to fail to support the marine life living there. Historically, many of these sites were naturally occurring. However, in the 1970s, oceanographers began noting increased instances and expanses of dead zones.

Dead zone (ecology) - Wikipedia

Dead zones are places in the ocean or other bodies of water characterized by having a low oxygen concentration. Dead zones occur naturally, but the number and severity of hypoxic zones are largely tied to human activities. Nutrient pollution is the primary cause of dead zones. Nutrients from wastewater stimulate algae growth.
