Chemical structure of flavonoids. Their basic structure is a skeleton of diphenylpropane, namely, two benzene rings (ring A and B, see figure) linked by a three carbon chain that forms a closed pyran ring (heterocyclic ring containing oxygen, the C ring) with benzenic A ring. Therefore, their structure is also referred to as C6-C3-C6.

Flavonoids consist of a single benzene ring joined to a benzo-gamma-pyrone structure. They are formed from three acetate units and a phenylpropane unit (via the shikimic acid pathway). More than 2000 are known with nearly 500 occurring in the free (aglycone) state and the rest as O- or C-glycosides.

Flavonoids - an overview | ScienceDirect Topics

Flavonoids have a core structure called the aglycone, which contains a diphenylpropane backbone (C 6-C 3-C 6) and various types and numbers of substituents (e.g. glycosyl and acyl groups) 12. This is similar to lipids, which have head groups containing various acyl residues 7 .

Flavonoids are a class of polyphenolic plant and fungus secondary metabolites. Chemically, flavonoids have the general structure of a 15-carbon skeleton, which consists of two phenyl rings and a heterocyclic ring. This carbon structure can be abbreviated C6-C3-C6. According to the IUPAC nomenclature, they can be classified into: flavonoids or bioflavonoids isoflavonoids, derived from 3-phenylchromen-4-one structure neoflavonoids, derived from 4-phenylcoumarine structure The three flavonoid class

Flavonoid - Wikipedia

Since flavonoids are directly associated with human dietary ingredients and health, there is need to evaluate structure and function relationship. The bioavailability, metabolism, and biological activity of flavonoids depend upon the configuration,
