Copyright © McGraw-Hill Education Fossil Evidence of Change Clues in Rocks The fossil record • A fossil is any preserved evidence of an organism. • 99% of the species that have ever lived are now extinct, but only a small percentage remain as fossils. • Most organisms decompose before they have a chance to become fossilized.

Section 1: Fossil Evidence of Change

Students will look at changes in tooth size and shape (morphology) in the fossil record of herbivorous mammals in North America using data from a recent paleontological study. Students will infer factors which caused the observed evolutionary adaptations and link biological adaptation with global climate change and localized habitat change.

Teacher Resource - NPS.gov Homepage (U.S. National Park ...

Scientists have found “statistically robust evidence” that climate change drove early human species extinct. Published in the journal One Earth Thursday, the study combined fossil records and climate modeling for the last 5 million years in order to understand the climate preferences of early humans and how they reacted to climate changes. The period studied by the researchers covers the ...

Climate Change Drove the Extinction of Other Early Human ...

14.1 Fossil Evidence of Change Land Environments The History of Life Chapter 14 Earth formed about 4.6 billion years ago. Gravity pulled the densest elements to the center of the planet. After about 500 million years, a solid crust formed on the surface.

Study Guide Section 1 Fossil Evidence Of Change Answers

The fossil evidence. By 3.5 million years ago at least one hominin species, Au. afarensis, was an adept walker.In addition to anatomic evidence from this time, there is also a 27.5-metre (90-foot) trackway produced by three individuals who walked at a leisurely pace on moist volcanic ash at Laetoli in northern Tanzania.In all observable features of foot shape and walking pattern, they are ...

Human evolution - The fossil evidence | Britannica

Key Points. Fossils are the preserved remains or traces of animals, plants, and other organisms from the past. Fossils are important evidence for evolution because they show that life on earth was once different from life found on earth today. Usually only a portion of an organism is preserved as a fossil, such as body fossils (bones and exoskeletons), trace fossils (feces and footprints), and chemofossils (biochemical signals).
